Subject: Verify Network hardware communication before installing the system on a large complex commercial network

Models: All Network locks, software and gateways

The versatility of the Alarm Lock Network system allows the Gateways and wireless locks to communicate over many different types of networks. For this reason, it is always a good idea to “bench test” the equipment in a controlled environment prior to final installation.

The main advantage of bench testing is that if a communication issue occurs during the installation and configuration of the system, you will already know the issue is not the fault of the Alarm Lock hardware; you can then concentrate on troubleshooting the network itself.
